

Organic root protection.

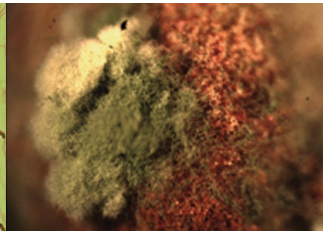

Background

- T-22™ Planter Box (T-22 PB) is a biological fungicide for the prevention of root diseases. The active ingredient is a beneficial microbe, *Trichoderma harzianum* Strain T-22 (KRL-AG2). Applied to seeds T-22 PB actively grows onto and with plant roots as they develop and provides protection against plant root pathogens such as pythium, Rhizoctonia, Fusarium, Cylindrocladium and Thielaviopsis.
- T-22 PB is an organic, OMRI-Listed product. Germain's ProBio T-22 product is certified organic by Agricultural Services Certified Organic, LLC. T-22 PB is approved in Mexico as a seed treatment by SAGARPA.
- Seed treated with ProBio T-22 will also contain an organic dye imparting an unnatural color to the seed as required by the EPA.

Control

Planting Conditions

- All seed should be stored in cool dry conditions. Germain's recommends storage conditions of 40% or less humidity, and temperatures not to exceed 70° Fahrenheit (24°C.) Germain's recommends planting products within six months of the product label date. Depending upon a range of conditions, seed can be stored; however, products should be tested for germination and emergence every six months from the product label date. T-22 PB activity will not last past six months unless seed is stored in cold storage. Increased humidity during storage will also decrease shelf life of T-22 PB.
- Germain's Product Performance Guidelines must be adhered to at the point of sale and the transfer or resale of the product through the retail chain. It is the responsibility of the point of sale purchaser to educate and inform any resale or transfer customers of Germain's Product Performance Guidelines.
- Point of sale customers who do not follow Germain's Product Performance Guidelines do so at their own risk.
